Duplicate files are files that have an exact duplicate on disk. Many operating systems will, by default, show only one instance of a file (the "original" instance), however, the file might actually exist in two separate locations (to which the operating system might have access). The "duplicate" instance is simply another name for the same file, and is saved on the disk in some directory separate from the one in which the original instance is stored. A "duplicate" file can sometimes indicate a compromised system, or even a hacking attempt. Duplicates may be a normal function of certain software programs. For example, image and audio files are often saved on disk as a single file, and are actually stored in separate parts (e.g., a bitmap file and an audio file). In this case, the program that created the file might have saved copies of the file on the disk, with the idea that if the file is corrupted, the original and a copy are available to be reloaded from disk. In such cases, Duplicates is a program that can be used to scan the disk for copies of files that are considered duplicates, and can be useful if you do not wish to do the searching yourself. Duplicates will show the same files found by "Other programs" or Windows Explorer. The result can be saved to a file, or can be printed directly. If the latter, all duplicate instances will be saved as text files and arranged alphabetically by name. Note that the algorithm used by Duplicates is often very efficient, and will quickly scan a system that is being used, even if it is loaded with other processes. This program has not been tested extensively with modern versions of Windows, so there may be bugs. There is also a commercial version, which has support, features, and instructions for use. Duplicates also offers a part-time support service for its commercial version.
